The Problem - Nosocomial Pneumonia

Nosocomial pneumonia presents a complex treatment challenge for healthcare professionals which increases risk of morbidity and mortality for patients in all healthcare settings, from acute to long term care. The impact of nosocomial pneumonia includes:

- increased length of stay
- increased patient care intensity for staff
- higher facility resource utilization levels
- substantially increased healthcare costs

Ventilated patients are particularly at risk for nosocomial pneumonia and Ventilator-Associated Pneumonia (VAP):

- Ventilated patients are at higher risk for pneumonia due to aspiration of oral secretions related to endotracheal intubation
- VAP can occur in greater than 10% of ventilated patients.
- Hospital Associated Pneumonia (HAP) potential increases with length of mechanical ventilation by 6-21 times

Recent studies have found that a number of patient care measures, including oral hygiene, can help reduce pneumonia rates. Oral hygiene has been determined to be important as:

- the oral cavity can be colonized with pathogens that can lead to nosocomial pneumonia and VAP.
- dental plaque can be a critical reservoir for these bacteria.

Studies have shown a 60% reduction in VAP rates after implementation of a comprehensive oral care program.

Patients in long-term care settings are at increased risk of Community Acquired Pneumonia (CAP) due to aspiration of oral secretions from dysphagia caused by stroke, Alzheimer’s disease, Parkinson’s disease and other conditions.

Formal oral care protocols have been shown to play an important role in reducing nosocomial pneumonia, including VAP, by reducing dental plaque and bacteria levels in the oral cavity through routine brushing and cleaning of the mouth. These findings led to the CDC Guidelines for Preventing Healthcare-Associated Pneumonia, 2003, which recommends that healthcare facilities “develop and implement a comprehensive oral-hygiene program” to reduce pneumonia rates.

The Plak-Vac Oral Care Kit

Plak-Vac Oral Care Kits provide a customized, component formulary to assure the implementation of your protocol while minimizing cost and waste. Our unique approach offers benefits that “off the shelf” solutions can’t:

- Collaboration in incorporating the institution’s best practices protocol into a customized oral care delivery kit.
- Incorporation of unique details such as protocol instructions, treatment times and product components into the kit packaging.
- Individualized treatment intervals including q2, q4, q8, q12, q24, or any combination.
- Accommodation of both acute and long term care needs.

Plak-Vac Oral Care Kits offer a customized, comprehensive point of care delivery approach that assures ease of use to facilitate staff implementation and increase compliance.
Trademark Medical has developed the Plak-Vac Oral Care System to facilitate implementation of an oral care program.

The Plak-Vac System includes:

The Plak-Vac Suction Toothbrush
Plak-Vac is a reusable single patient use oral hygiene instrument. The Plak-Vac Suction Toothbrush has been in use for over 17 years and provides the ultimate in oral hygiene. A combination suction instrument and toothbrush, the Plak-Vac allows the removal of debris, plaque, bacteria and fluid from the mouth. The Plak-Vac has soft bristles that are gentle to gums, teeth and other tissues in the mouth. Suction level is controlled by a finger control port located in the Plak-Vac handle.

The Plak-Vac Storage Holder
The Plak-Vac Storage Holder provides a simple, convenient, and hygienic way to store the Plak-Vac suction toothbrush between uses. Made of translucent polypropylene, the Plak-Vac storage holder helps avoid contamination of the Plak-Vac toothbrush by preventing accidental contact with bed linens, furniture and other potentially contaminated surfaces. The Plak-Vac storage holder is great for storing other patient care devices such as yankauer suction instruments, as well. Use with the Plak-Vac storage holder bracket or clip.

Typical Custom Plak-Vac Oral Care Treatment Pouch

**Oral Care Procedure**

- **Brush teeth, palate and gums**
  - Clean patient's teeth, palate and gums with the Plak-Vac oral suction brush and toothpaste.
  - Brush for approximately 1-2 minutes. Exert gentle pressure while moving in short horizontal or circular strokes. Gently brush the surface of the tongue. If patient has no teeth use a brush to their gums and roof of mouth gently with toothpaste to remove plaque and stimulate the gums.
  - If brush causes bleeding or discomfort use a soft swab or suction swab. Place swab perpendicular to gums and apply gentle mechanical action for 1-2 minutes. Turn swab in circular motion to remove mucous and debris.
  - Assess and remove subglottic secretions Provide deep suction, as needed, to intubated patients to remove airway secretions that have migrated down the tube and settled on top of the cuff.
  - As recommended: Normal saline should not be instilled down the ETT or tracheostomy tube while suctioning. Normal saline should only be used to clean or rinse out the suction catheter after each use.

**Pouch Contents**

- Swab
- Mouthwash
- Lip moisturizer
- Suction catheter
- Toothpaste
A. Plak-Vac Suction Toothbrush
Reorder No.: 2200-K, 144 per case

B. Plak-Vac Storage Accessories
Reorder No.:
2700 Plak-Vac Storage Holder, 50 per case
2701 Plak-Vac Storage Holder Bracket, each
2702 Plak-Vac Storage Holder Clip, 25 per case

C. Applicator Swabs
Reorder No.: 2710 Untreated foam applicator swab.
50 bags of 20 swabs, 1000 swabs per case.

D. Mouth Wash
Reorder No.: 2720 Mint flavored 1.5% Hydrogen peroxide mouth wash. 0.34 ounce foil packet.
100 packets per case.

E. Mouth and Lip Moisturizer
Reorder No.: 2740 Mint flavored mouth and lip moisturizer 2 gram tube. 150 tubes per case.
